Discussion points

- Review of basic content of PAW datasets for various codes
 - abinit, quantum espresso, socorro, (pwpaw), GPAW??
- atompaw 3.0.1.9 → 4.0.0.0
 - Modular programming structure 
 - More robust atomic solver 
 - Some new options for pseudo functions 
 - Option for systematic exploration of pseudo parameters 
 - Hartree-Fock and hybrid functionals
 - Integration with features developed by Marc Torrent, François Jollet, etc

Basic content of PAW datasets

Basic principles of “Projector Augmented Wave” method
(P. Blöchl, *Phys. Rev. B* **50**,17953 (1994))

Provides mapping between full (“all-electron”)

wavefunctions and pseudo-wavefunctions $\Psi_s \Leftrightarrow \tilde{\Psi}_s$

atom-centered functions:

$$|\Psi_s\rangle = |\tilde{\Psi}_s\rangle + \sum_{a,i} \left(|\varphi_i^a(\mathbf{r} - \mathbf{R}^a)\rangle - |\tilde{\varphi}_i^a(\mathbf{r} - \mathbf{R}^a)\rangle \right) \langle p_i^a | \tilde{\Psi}_s \rangle$$

full basis
function

pseudo
basis
function

projector
function

PAW evaluations – separated into extended “pseudo” and atom-centered contributions

$$E_{tot}^{vale} = \underbrace{\tilde{E}_{tot}}_{\text{pseudo energy}} + \sum_a \underbrace{\left(E_{tot}^a - \tilde{E}_{tot}^a \right)}_{\text{atom-centered corrections}} .$$

→ compensation charge

→ local pseudopotential

$$\hat{\rho}^a(r)$$

$$\tilde{V}_{loc}^a(r)$$

→ core electron information

ATOMPAW

Download source code and example files:

- [atompaw-3.0.1.9.tar.gz](#) (3.8mb) Updated version of *atompaw* code (09/20/2012 -- Yann Pouillon updated the autotools for constructing the tar file; 07/16/2012 -- Geoffrey Pourois corrected GIPAW portion of *pwsconfinterface.f90*; 06/26/12 -- NAWH corrected bug in *pwsconfinterface.f90* on top of previous revisions on 06/13/12 and 04/14/12 by Marc Torrent), and previous changes 10/03/11 by Marc Torrent and Yann Pouillon updating interface for use with LibXc. This version is still compatible with *pwsconf* including recent addition by D. Ceresoli for *gipaw* calculations. The 3.0+ versions have several features due largely to the magic of Marc Torrent (CEA, France) and Yann Pouillon (ETSF, Spain) including compatability for use with LibXC.
 - The code package now complies with linux installation standards.
 - Using new options in the input file, datasets for use with [abinit](#) (replacing the need to run the separate *atompaw2abinit* code) or [pwsconf-quantum-espresso](#) can be generated. (For developing the UPF file for use with [pwsconf](#), help from Lorenzo Paulatto and Paolo Giannozzi is gratefully acknowledged.)
 - The use of *atompaw* with [LibXC](#) library of exchange-correlation functionals are now possible for generating datasets for [abinit](#).
 - Details are given in the [user's guide](#) written by Marc Torrent.
 - Some details concerning choices of the shapes of compensation charge densities have been clarified as explained in a recent [publication](#).
 - Simple [gnuplot scripts](#) are available to help analyze some of the outputs of the *atompaw* program.
- [pwpaw 2.4.tar.gz](#) (0.2 mb) Updated 05/12/2010 version of *pwpaw* with very minor changes to accomodate changes to input files generated by new *atompaw* output files; also includes a BSD license file.
- [Older versions of atompaw and pwpaw](#)

Some notes on formalism (PDF format):

- [Notes on new atompaw implementation](#)
Also presented is a discussion of the relationship between *pwpaw* and *abinit* implementations of the PAW equations.
- [Notes on crystal symmetry](#)
- [Notes on generalized coordinates](#)
- [Notes on GGA implementation](#)
- [Notes on scalar-relativistic implementation](#)

Thanks to Sina Zolghadr (with help from Eric Chapman) for the webpage design.

Past students contributing to this effort: John Tumbleston, Nick Dellaripa, David Harris, Xiao Xu, Nicholas Lepley, Sina Zolghadr

How hard could it be to generate efficient and accurate PAW datasets for the entire periodic table??

Unfortunately, I have not yet found the secret recipe...

With the help of two undergraduate students – James Drewer and Cameron Kates – we hope to update the PAW datasets on the <http://pwpaw.wfu.edu> web page including output for use in *abinit*, *quantum espresso*, and *GPAW*??

Example functions for Cl 3s

Example functions for CI

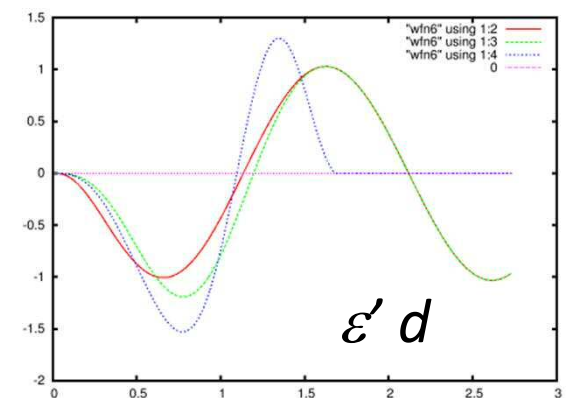

$\ell = 0$

$\ell = 1$

$\ell = 2$

Quality measurements for datasets

- **Logderivatives**
- **Binding energy curves for representative solids**
- **Plane wave convergence properties**

➤ Logderivatives

For each ℓ , solve the Schrodinger equation for range of energies E ; at a radius r_c compare all electron (AE) and reconstructed PAW wavefunctions :

$$L_\ell^{AE}(E) \equiv \left. \frac{d\Psi_{\ell E}^{AE} / dr}{\Psi_{\ell E}^{AE}} \right|_{r_c} \quad L_\ell^{PAW}(E) \equiv \left. \frac{d\Psi_{\ell E}^{PAW} / dr}{\Psi_{\ell E}^{PAW}} \right|_{r_c}$$

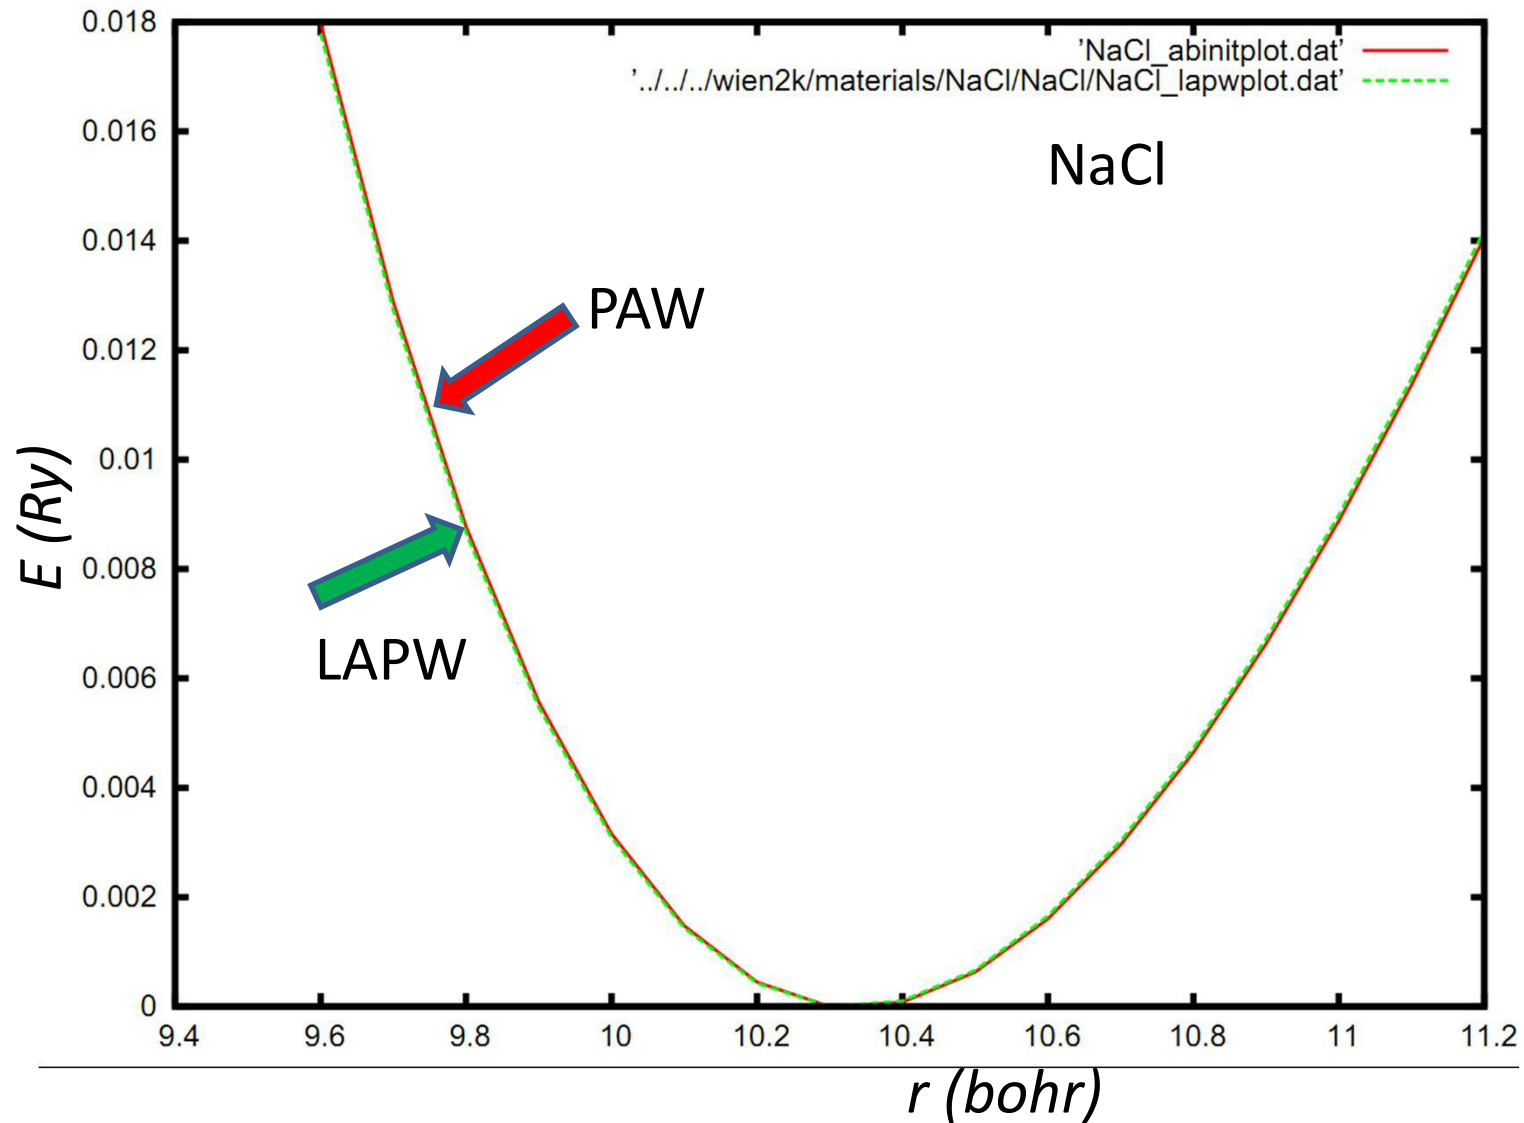

Complete logderivatives for CI

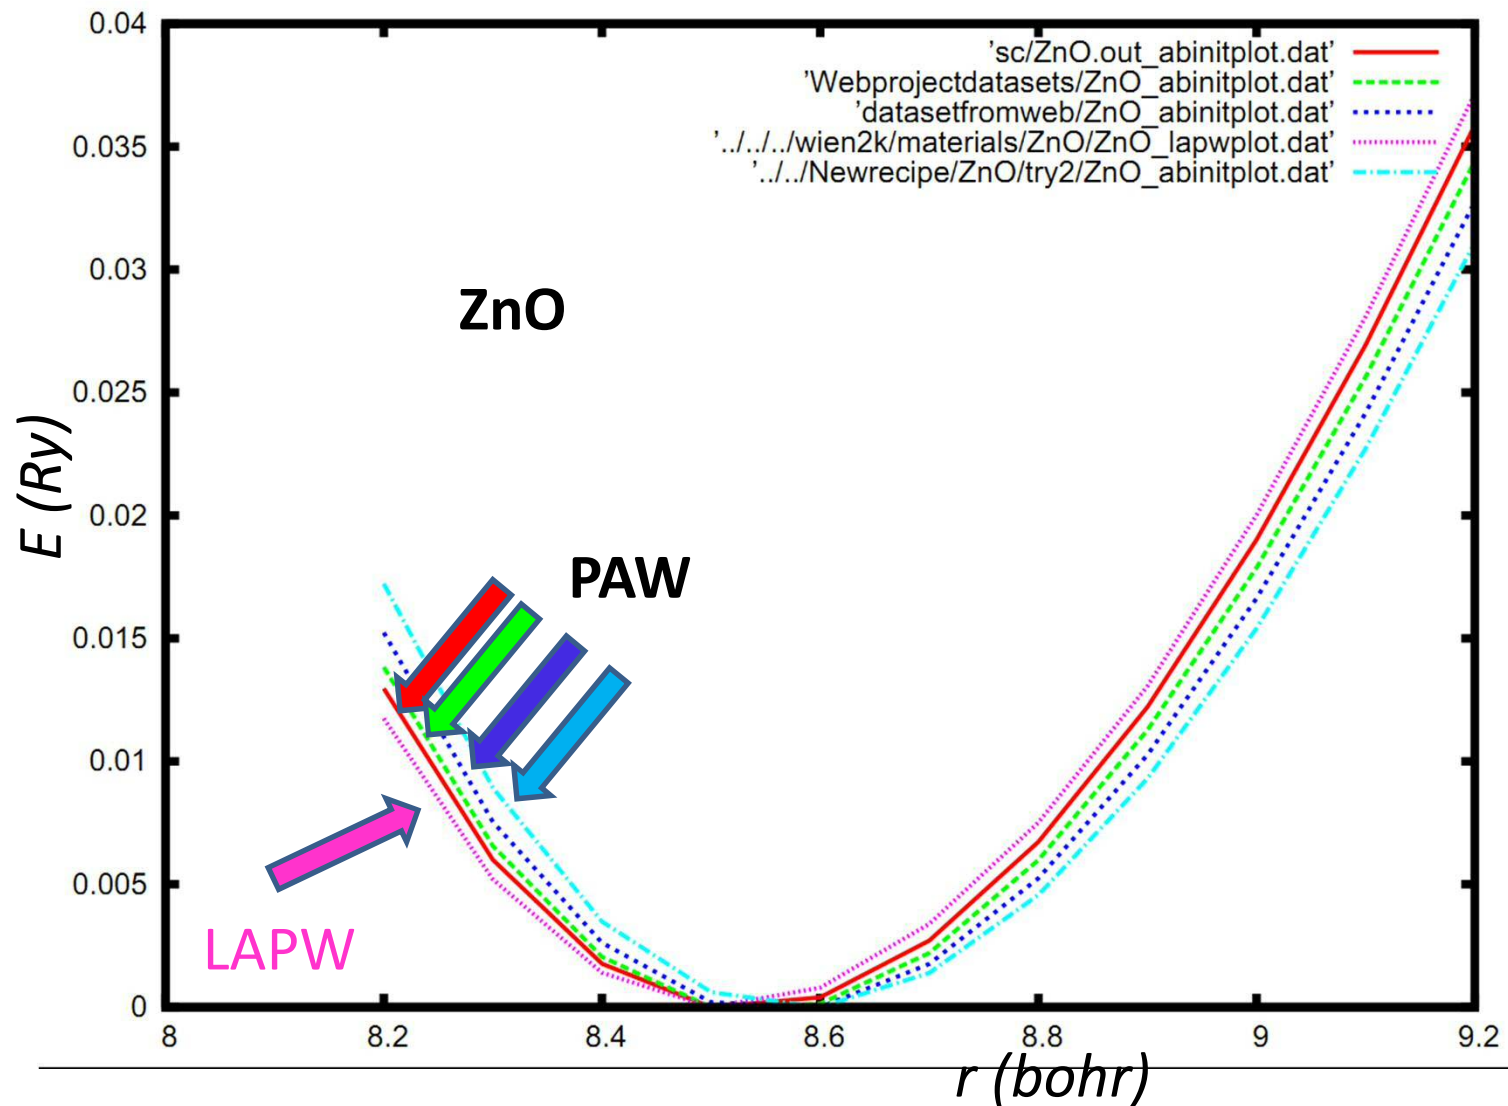

Another example of logderivatives – for S_n

➤ Binding energy curves

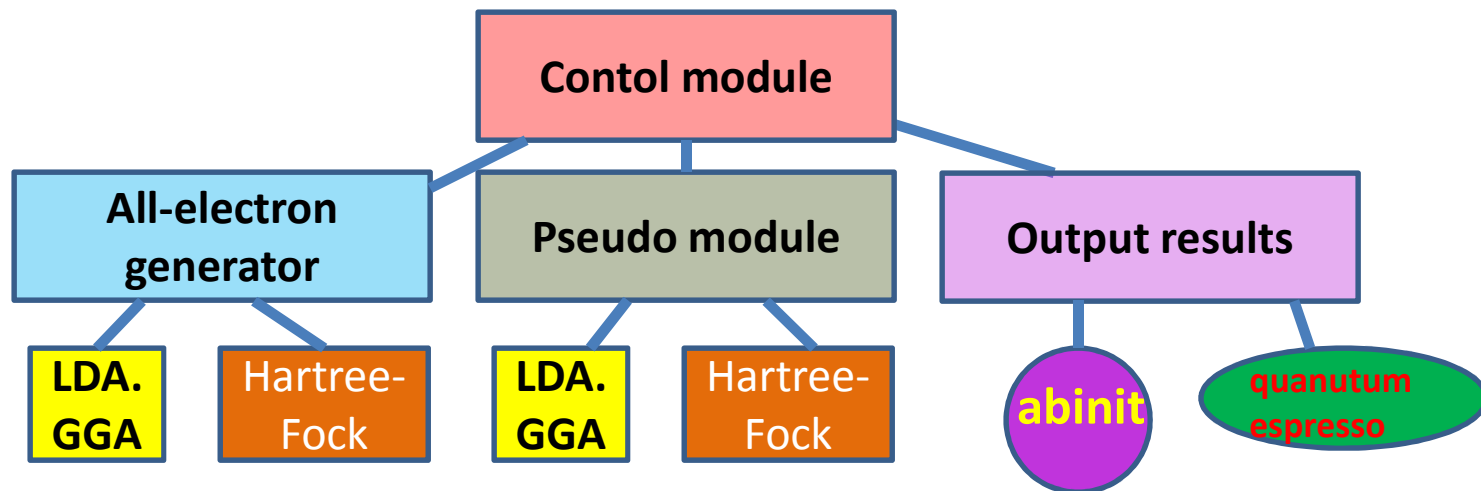

Another example of binding energy curves -- ZnO

Some ideas

➤ Modular program structure (from Xiao Xu)

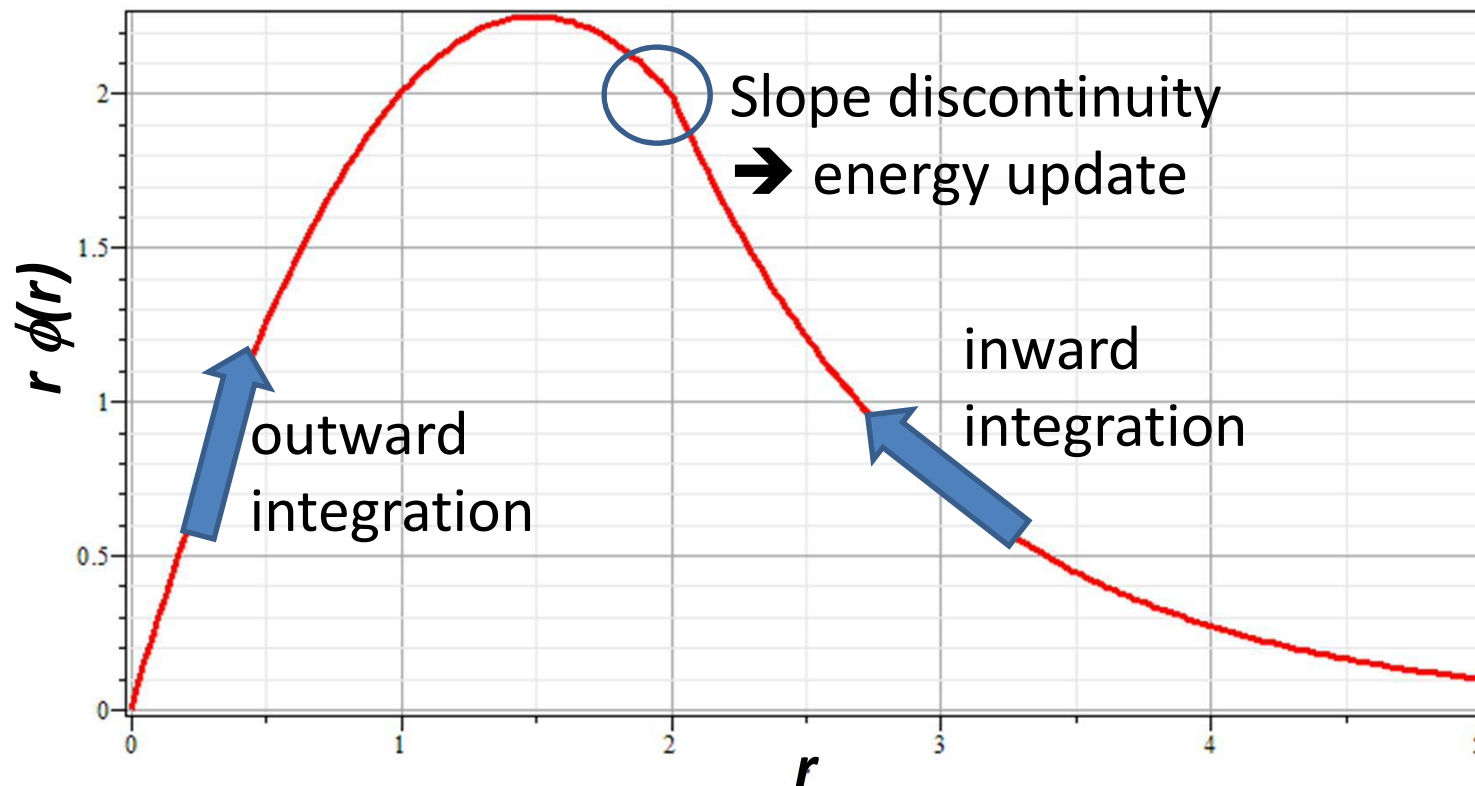

Goal – make it easier to modify the code to implement new ideas and capabilities

Some ideas -- continued

➤ More robust all-electron bound state solver

Traditional solver (from Hartree's text book)

Some ideas -- continued

- **More robust all-electron bound state solver – continued**
Hartree's method works well for reasonable good guesses of the atomic bound state energies ε_{nl} , but occasionally convergence is difficult.

Basic idea : Use grid discretization $f_i^{nl} \equiv f^{nl}(r_i)$ and boundary values $f_i^{nl} = f_i^{nl} = 0$ as a $(N-1) \times (N-1)$ matrix eigenvalue problem : $Mf^{nl} = \varepsilon_{nl} f^{nl}$ or more generally $Mf^{nl} = \varepsilon_{nl} S f^{nl}$ where both M and S are determined by the finite difference method (such as Numerov). Eigenvalues ε_{nl} are determined by iterative diagonalization. Once ε_{nl} are determined, need to run Hartree method to get final functions $f^{nl}(r)$.

Some ideas -- continued

- **Some new options for pseudo functions – “MODRRKJ”**
A new option to control the shape of the pseudo basis functions

Vanderbilt* polynomial scheme:
$$r\tilde{\varphi}_{n_i\ell_i}^a(r) = \begin{cases} r^{\ell_i+1} \sum_{s=0}^S C_s r^s & \text{for } r \leq r_c \\ r\varphi_{n_i\ell_i}^a(r) & \text{for } r > r_c \end{cases}$$

modRRKJ** scheme:
$$r\tilde{\varphi}_{n_i\ell_i}^a(r) = \begin{cases} r \sum_{s=1}^S C_s j_{\ell_i}(k_s r) & \text{for } r \leq r_c \\ r\varphi_{n_i\ell_i}^a(r) & \text{for } r > r_c \end{cases}$$

*D. Vanderbilt, PRB **41**, 7892 (1990)

A. M. Rappe, K. M. Rabe, E. Kaxiras, J. D. Joannopoulos, PRB **41, 1227 (1990)

Some ideas -- continued

➤ “MODRRKJ” -- continued

$$\text{modRRKJ}^{**} \text{ scheme: } r\tilde{\varphi}_{n_i\ell_i}^a(r) = \begin{cases} r \sum_{s=1}^S C_s j_{\ell_i}(k_s r) & \text{for } r \leq r_c \\ r\phi_{n_i\ell_i}^a(r) & \text{for } r > r_c \end{cases}$$

The nodes are controlled by the choice of k_s . In practice, we choose 5 values of k_s : $k_s = k_0 + (s-3)\delta k$ for $s = 1, 2, \dots, 5$ and k_0 is chosen so that $rj_{\ell_i}(k_0 r)$ has the correct number of nodes in the range $0 \leq r \leq r_c$ and so that

$$\left. \frac{d[rj_{\ell_i}(k_0 r)]/dr}{rj_{\ell_i}(k_0 r)} \right|_{r_c} = \left. \frac{d[r\phi_{n_i\ell_i}(r)]/dr}{r\phi_{n_i\ell_i}(r)} \right|_{r_c} ; \quad \delta k r_c \approx \pi / 20 \text{ and } C_s \text{ are the non-singular}$$

solutions to: $r_q \sum_{s=1}^S C_s j_{\ell_i}(k_s r_q) = r_q \phi_{n_i\ell_i}^a(r_q)$ at 5 radii r_q near r_c .

****A. M. Rappe, K. M. Rabe, E. Kaxiras, J. D. Joannopoulos, PRB **41**, 1227 (1990)**

➤ Options for systematic exploration of pseudo parameters

Problem: There are many pseudopotential parameters that can be varied in the preparation of PAW datasets .

Machine optimization solution: Developed by Alan Wright (Sandia National Laboratory), Alan Tackett, Greg Walker, and Rachael Hansel (Vanderbilt University). (Manuscript in preparation.)

Some ideas -- continued

- **Options for systematic exploration of pseudo parameters -- continued**

Partial solution implemented into atompaw 4.0.0.0 (with inspiration from Qi Li); for a given all-electron configuration, the new version of the program allows you to run up to 9999 sets of input parameters, keeping track of the best overall success value for each / channel.

Merit criterion based on logderivative accuracy

$$L_{\ell}^{AE}(E) \equiv \left. \frac{d\Psi_{\ell E}^{AE} / dr}{\Psi_{\ell E}^{AE}} \right|_{r_c} \quad L_{\ell}^{PAW}(E) \equiv \left. \frac{d\Psi_{\ell E}^{PAW} / dr}{\Psi_{\ell E}^{PAW}} \right|_{r_c}$$

Figure of merit for p^{th} pseudo parameter set for each ℓ :

$$M_{\ell p}^{\ell} = \sum_E \left| \tan(L_{\ell}^{AE}(E)) - \tan(L_{\ell}^{PAW}(E)) \right| \quad (\text{idea attributed to Alan Tackett})$$

➔ For each l channel, choose set with smallest $M_{\ell p}^{\ell}$

Summary

- **atompaw 3.0.1.9 → 4.0.0.0**
 - **Modular programming structure**
 - *Intended to facilitate future modifications*
 - **More robust atomic solver**
 - *Should be optimized; adapted to relativistic solver*
 - **Some new options for pseudo functions**
 - *MODRRKJ – further evaluation needed*
 - **Option for systematic exploration of pseudo parameters**
 - *Promising??*

Further work needed

- **Hartree-Fock and hybrid functionals**
 - *Preliminary version developed; not yet compatible with abinit*
- **Integration with features developed by Marc Torrent, François Jollet, etc**

Summary -- continued

Goals for atompaw collaboration

- To develop a flexible atomic PAW dataset generator for use in materials simulations
 - Control the numerical representation and allow for investigation of physical phenomena; in principle, PAW calculations should be competitive with all-electron frozen core calculations (such as LAPW or LMTO)
 - Provide outputs for use in several independent codes for solids (pwpaw, socorro, abinit, quantum espresso, perhaps GPAW??)
 - While a PAW dataset library is desirable, it will often be important to generate new datasets (for excited states, etc.)

**Thanks to the abinit community
for setting up and sustaining an
exemplary collaboration!**
