

Simulations of Idealized Solid Electrolytes*

Natalie A. W. Holzwarth

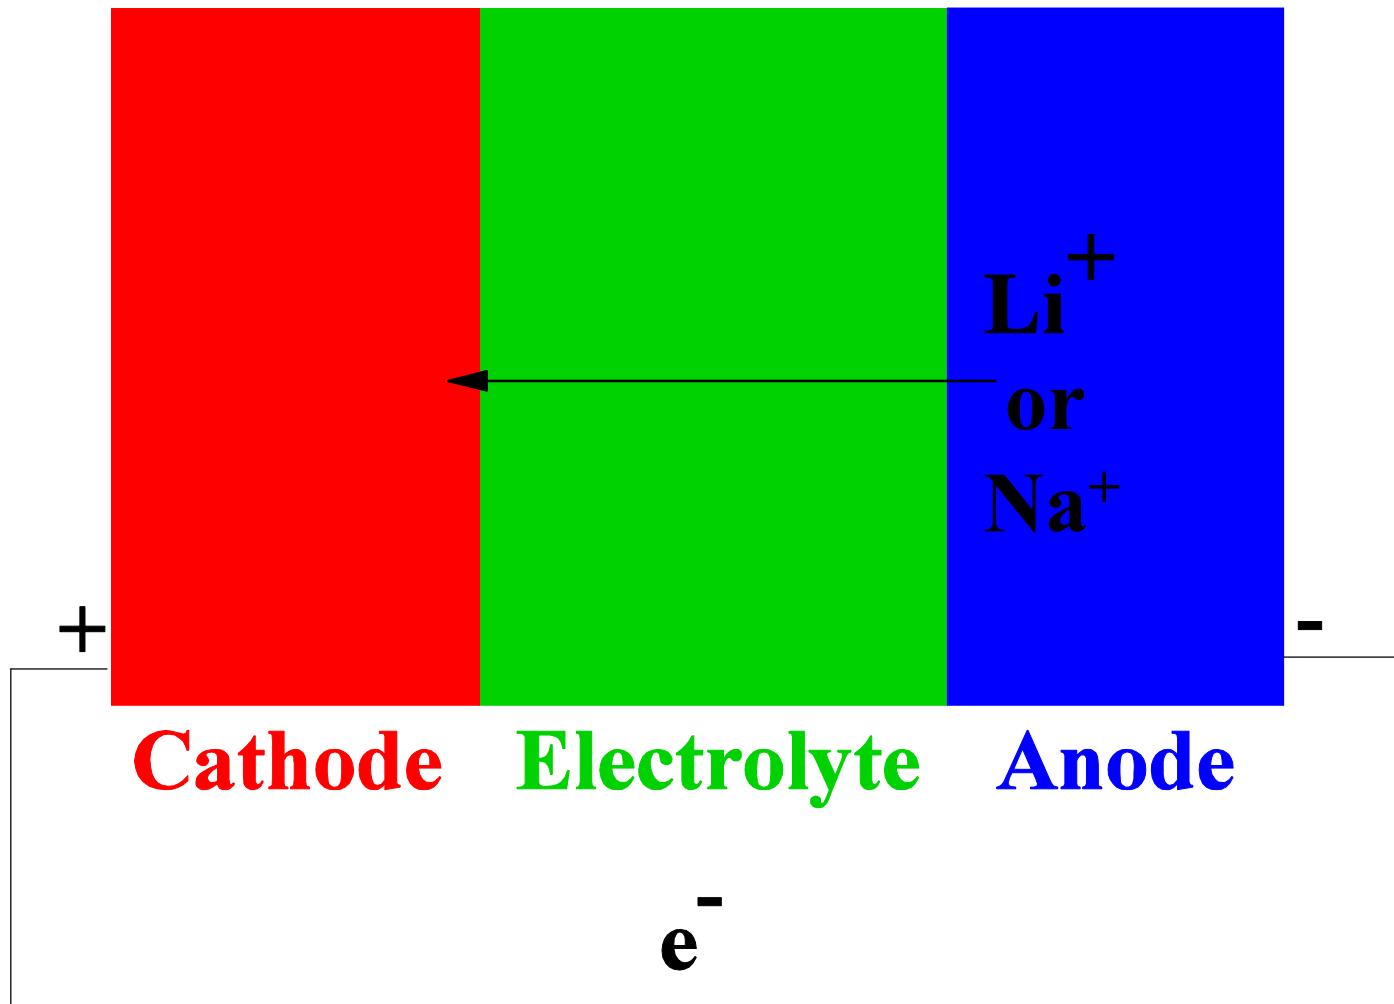

**Department of Physics, Wake Forest University
Winston-Salem, NC. 27109 USA**

*Research performed in collaboration with Nicholas Lepley (WFU Ph. D. Dec. 2015), Larry Rush Jr. (WFU MS May 2017), Jason Howard and Ahmad Al-Qawasmeh (WFU graduate students), Yaojun Du (former WFU Postdoc) and in consultation with Zachary Hood from ORNL and Ga Tech. Collaborations with WFU Chemistry Colleagues --Dr. Keerthi Senevirathne (now at Florida A & M U.), Dr. Cynthia Day, Professor Michael Gross, and Professor Abdessadek Lachgar, are also gratefully acknowledged. Research was supported by NSF grant DMR 1507942 and computations were performed on WFU's DEAC cluster.

Outline

- Motivation – Why solid electrolytes?
- Computational tools & reality checks; what can be learned from “first principles” calculations?
- Simulations of bulk properties and ion mobility
 - Li phosphorus oxynitrides (first developed at Oak Ridge National Laboratory)
 - Li thiophosphates
 - Related materials including Na electrolytes
- Simulations of interfaces with metallic Li and Na
- Summary and remaining challenges

Materials components of a Li or Na ion battery

$$V = IR$$

Solid Electrolyte: the Key for High-Voltage Lithium Batteries

Juchuan Li,* Cheng Ma, Miaofang Chi, Chengdu Liang, and Nancy J. Dudney*

Advantages

- Compatible and stable with high voltage cathodes and with Li metal anodes

Disadvantages

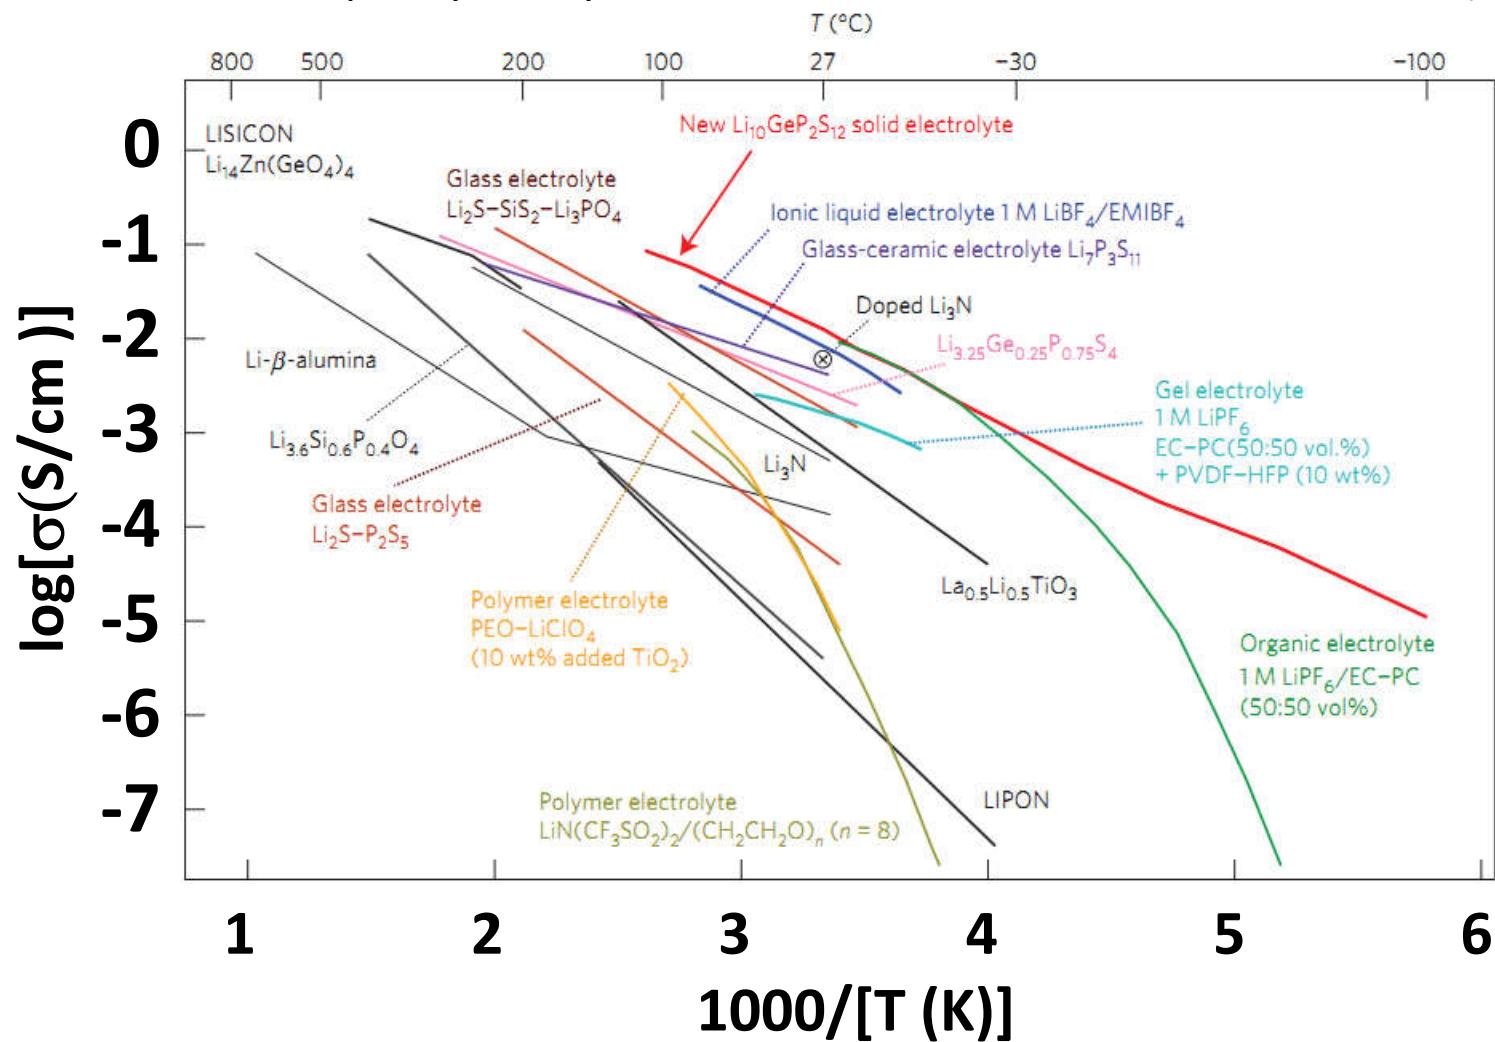

- Relatively low ionic conductivity
(Compensated with the use of less electrolyte?)
- Lower total capacity

Demonstrated for $\text{LiNi}_{0.5}\text{Mn}_{1.5}\text{O}_4/\text{LiPON/Li}$

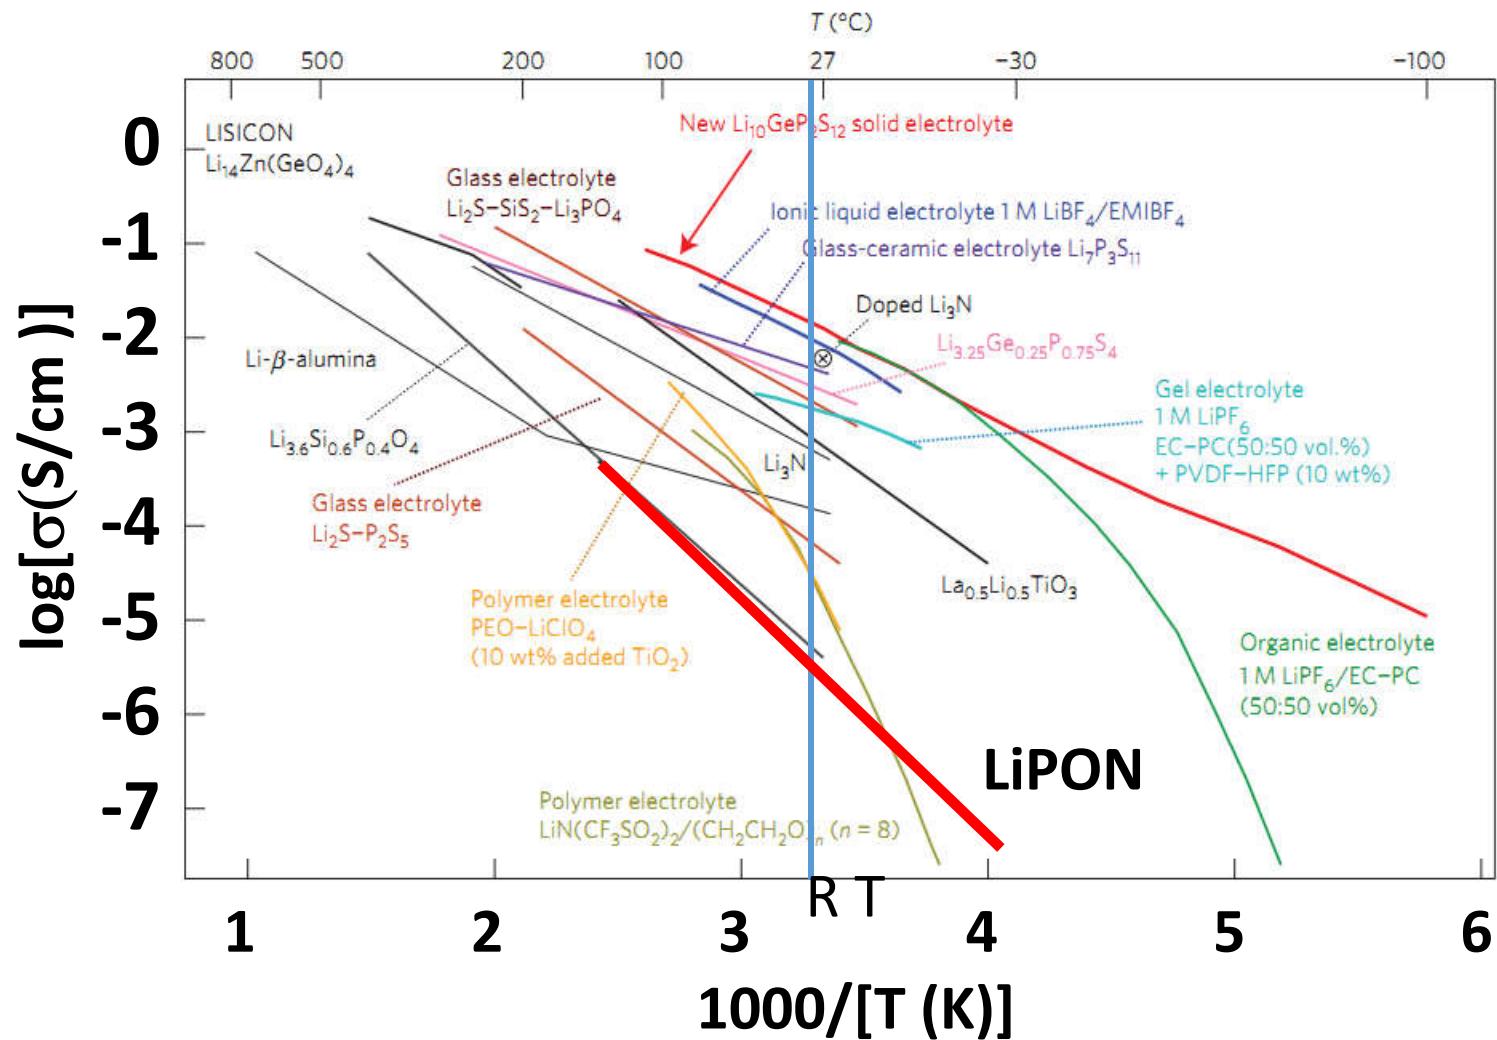

- 10^{-6} m LiPON electrolyte layer achieved adequate conductivity
- 10,000 cycles* with 90% capacity retention

*1 cycle per day for 27 years

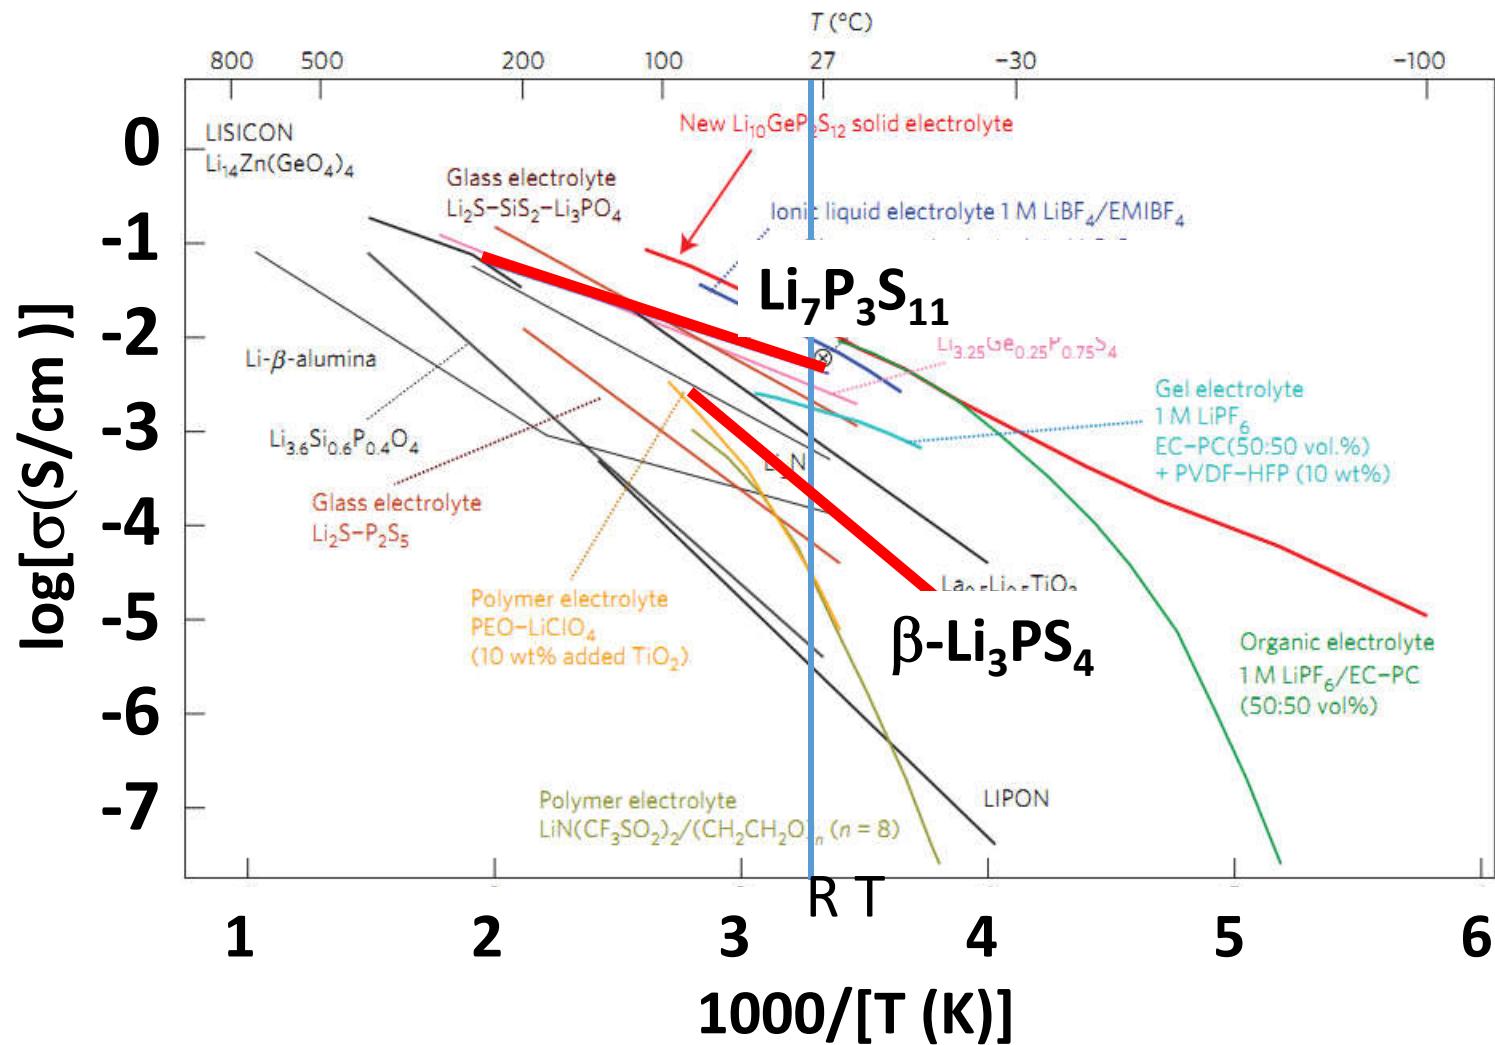

Motivation: Paper by N. Kayama, et. al in *Nature Materials* 10, 682-686 (2011)

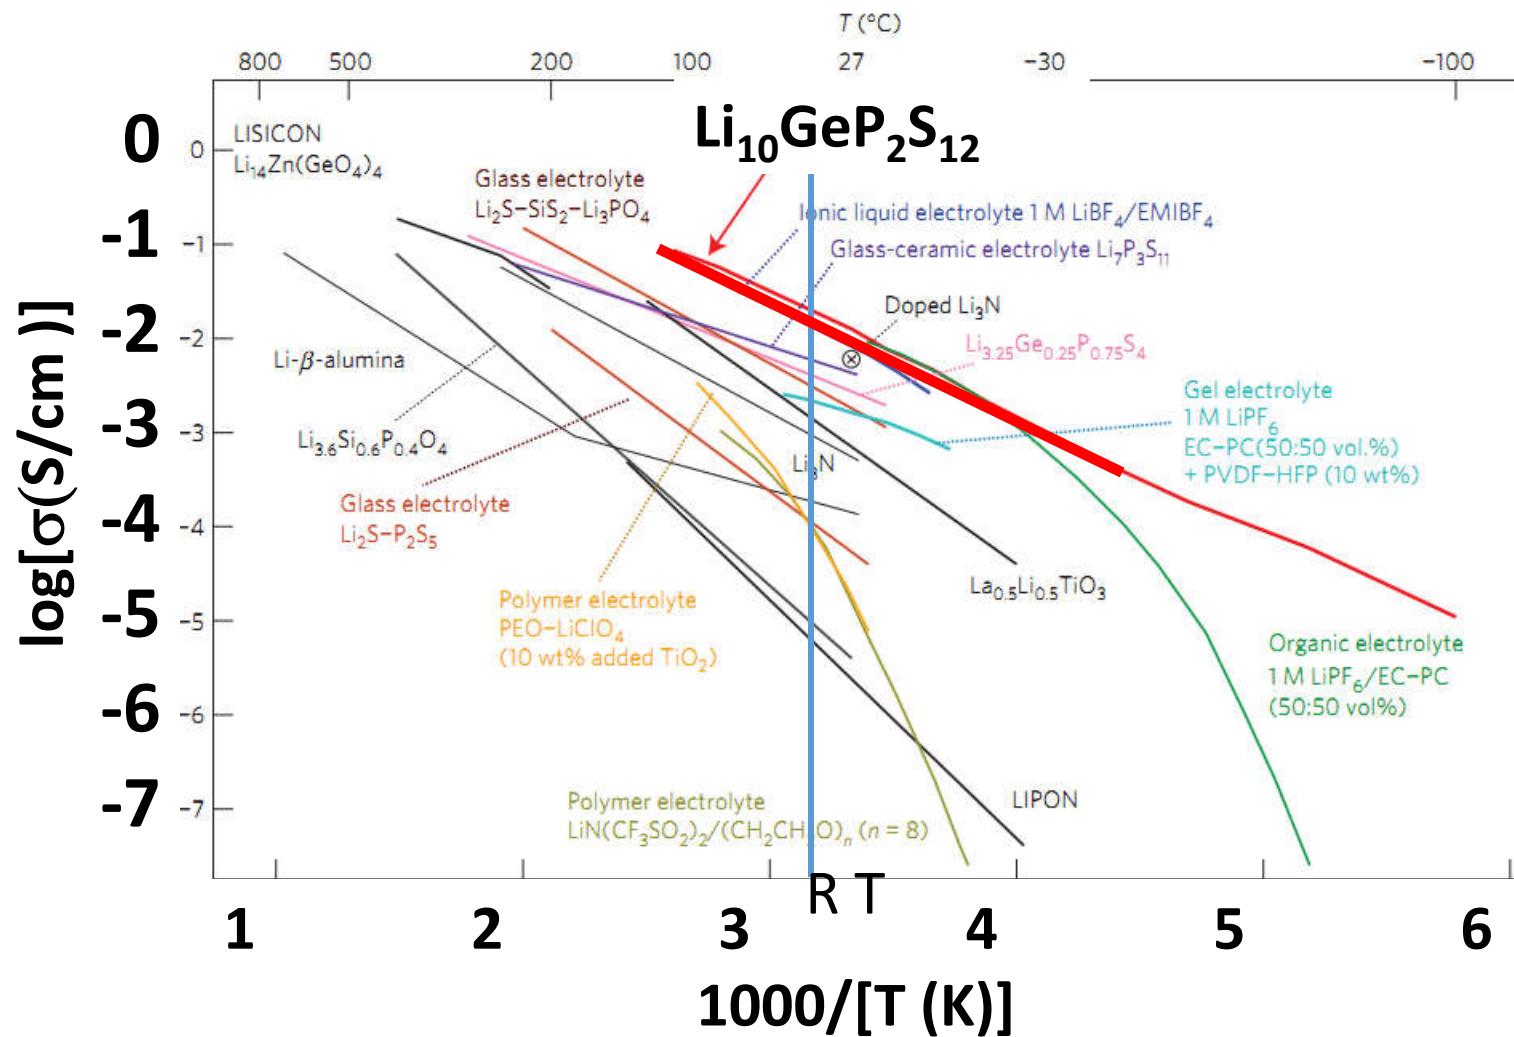

Motivation: Paper by N. Kamaya, et. al in *Nature Materials* 10, 682-686 (2011)

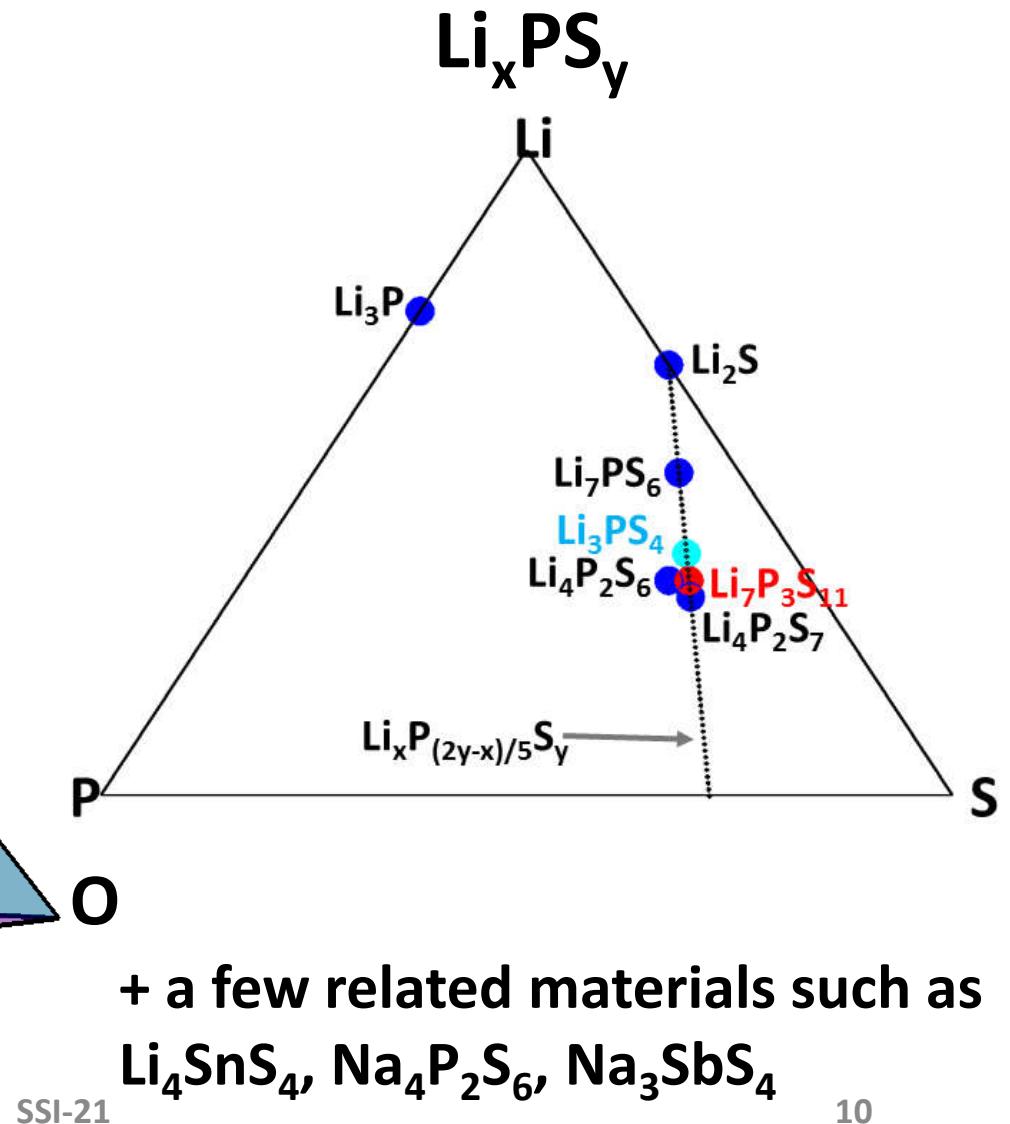

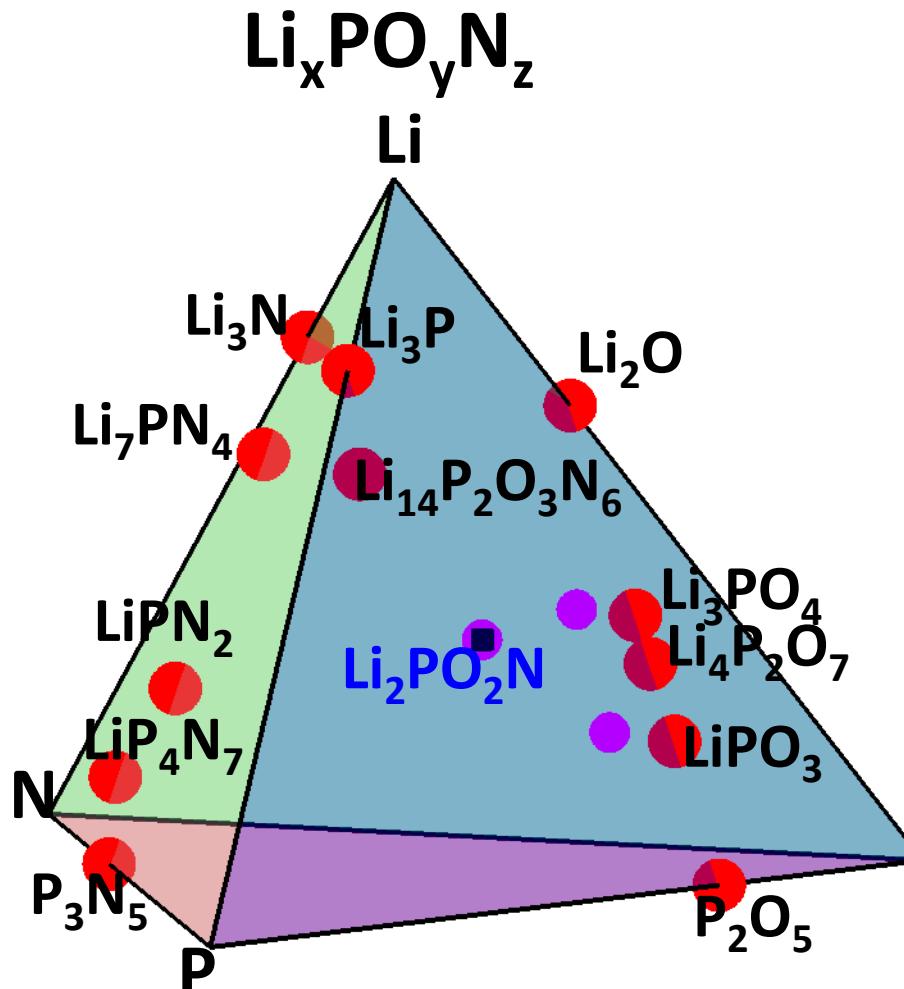

Motivation: Paper by N. Kamaya, et. al in *Nature Materials* 10, 682-686 (2011)

Solid electrolyte families investigated in this study:

Computational tools

Summary of “first-principles” calculation methods

Exact Schrödinger equation:

$$\mathcal{H}(\{\mathbf{r}_i\}, \{\mathbf{R}^a\}) \Psi_\alpha(\{\mathbf{r}_i\}, \{\mathbf{R}^a\}) = E_\alpha \Psi_\alpha(\{\mathbf{r}_i\}, \{\mathbf{R}^a\})$$

where

$$\mathcal{H}(\{\mathbf{r}_i\}, \{\mathbf{R}^a\}) = \mathcal{H}^{\text{Nuclei}}(\{\mathbf{R}^a\}) + \mathcal{H}^{\text{Electrons}}(\{\mathbf{r}_i\}, \{\mathbf{R}^a\})$$

Born-Oppenheimer approximation

Born & Huang, **Dynamical Theory of Crystal Lattices**, Oxford (1954)

Approximate factorization:

$$\Psi_\alpha(\{\mathbf{r}_i\}, \{\mathbf{R}^a\}) = X_\alpha^{\text{Nuclei}}(\{\mathbf{R}^a\}) Y_\alpha^{\text{Electrons}}(\{\mathbf{r}_i\}, \{\mathbf{R}^a\})$$

Treated with classical mechanics

Treated with density functional theory

Electronic Schrödinger equation:

$$\mathcal{H}^{\text{Electrons}}(\{\mathbf{r}_i\}, \{\mathbf{R}^a\}) Y_\alpha^{\text{Electrons}}(\{\mathbf{r}_i\}, \{\mathbf{R}^a\}) = U_\alpha(\{\mathbf{R}^a\}) Y_\alpha^{\text{Electrons}}(\{\mathbf{r}_i\}, \{\mathbf{R}^a\})$$

$$\mathcal{H}^{\text{Electrons}}(\{\mathbf{r}_i\}, \{\mathbf{R}^a\}) = -\frac{\hbar^2}{2m} \sum_i \nabla_i^2 - \sum_{a,i} \frac{Z^a e^2}{|\mathbf{r}_i - \mathbf{R}^a|} + \sum_{i < j} \frac{e^2}{|\mathbf{r}_i - \mathbf{r}_j|}$$

For electronic ground state: $\alpha \Rightarrow 0$

Density functional theory

Hohenberg and Kohn, *Phys. Rev.* **136** B864 (1964)

Kohn and Sham, *Phys. Rev.* **140** A1133 (1965)

Mean field approximation: $U_0(\{\mathbf{R}^a\}) \Rightarrow U_0(\{\rho(\mathbf{r})\}, \{\mathbf{R}^a\})$

Kohn-Sham construction: $\rho(\mathbf{r}) \approx \rho_{KS}(\mathbf{r}) = \sum_n |\psi_n(\mathbf{r})|^2$

$$\mathcal{H}_{KS}^{\text{Electrons}}(\mathbf{r}, \rho(\mathbf{r}), \{\mathbf{R}^a\}) \psi_n(\mathbf{r}) = \varepsilon_n \psi_n(\mathbf{r})$$

Independent electron wavefunction

More computational details:

$$\mathcal{H}_{\text{KS}}^{\text{Electrons}}(\mathbf{r}, \rho(\mathbf{r}), \{\mathbf{R}^a\}) = -\frac{\hbar^2 \nabla^2}{2m} + \sum_a \frac{-Z^a e^2}{|\mathbf{r} - \mathbf{R}^a|} + e^2 \int d^3 r' \frac{\rho(\mathbf{r}')}{|\mathbf{r} - \mathbf{r}'|} + V_{xc}(\rho(\mathbf{r}))$$

electron-nucleus electron-electron exchange-correlation

Exchange-correlation functionals:

LDA: J. Perdew and Y. Wang, Phys. Rev. B **45**, 13244 (1992)

GGA: J. Perdew, K. Burke, and M. Ernzerhof, PRL **77**, 3865 (1996)

HSE06: J. Heyd, G. E. Scuseria, and M. Ernzerhof, JCP **118**, 8207 (2003)

Numerical methods:

“Muffin-tin” construction: Augmented Plane Wave developed by Slater → “linearized” version by Andersen:

J. C. Slater, Phys. Rev. **51** 846 (1937)

O. K. Andersen, Phys. Rev. B **12** 3060 (1975) (LAPW)

Pseudopotential methods:

J. C. Phillips and L. Kleinman, Phys. Rev. **116** 287 (1959) -- original idea

P. Blöchl, Phys. Rev. B. 50 17953 (1994) – Projector Augmented Wave (PAW) method

Outputs of calculations:

Ground state energy:

$$U_0(\{\rho(\mathbf{r})\}, \{\mathbf{R}^a\}) \Rightarrow \text{Determine formation energies}$$

$$\min_{\{\mathbf{R}^a\}} (U_0(\{\rho(\mathbf{r})\}, \{\mathbf{R}^a\})) \Rightarrow \begin{aligned} &\text{Determine structural parameters} \\ &\Rightarrow \text{Stable and meta-stable structures} \end{aligned}$$

$$\begin{aligned} \rho_{KS}(\mathbf{r}) = \sum_n |\psi_n(\mathbf{r})|^2 &\Rightarrow \text{Self-consistent electron density} \\ \{\epsilon_n\} &\Rightarrow \text{One-electron energies; densities of states} \end{aligned}$$

Nuclear Hamiltonian (usually treated classically)

$$\mathcal{H}^{\text{Nuclei}}(\{\mathbf{R}^a\}) = \sum_a \frac{\mathbf{P}^{a2}}{2M^a} + U_0(\{\rho(\mathbf{r})\}, \{\mathbf{R}^a\}) \rightarrow \text{Normal modes of vibration}$$

Heats of formation – Experiment & Calculation

WAKE FOREST
UNIVERSITY

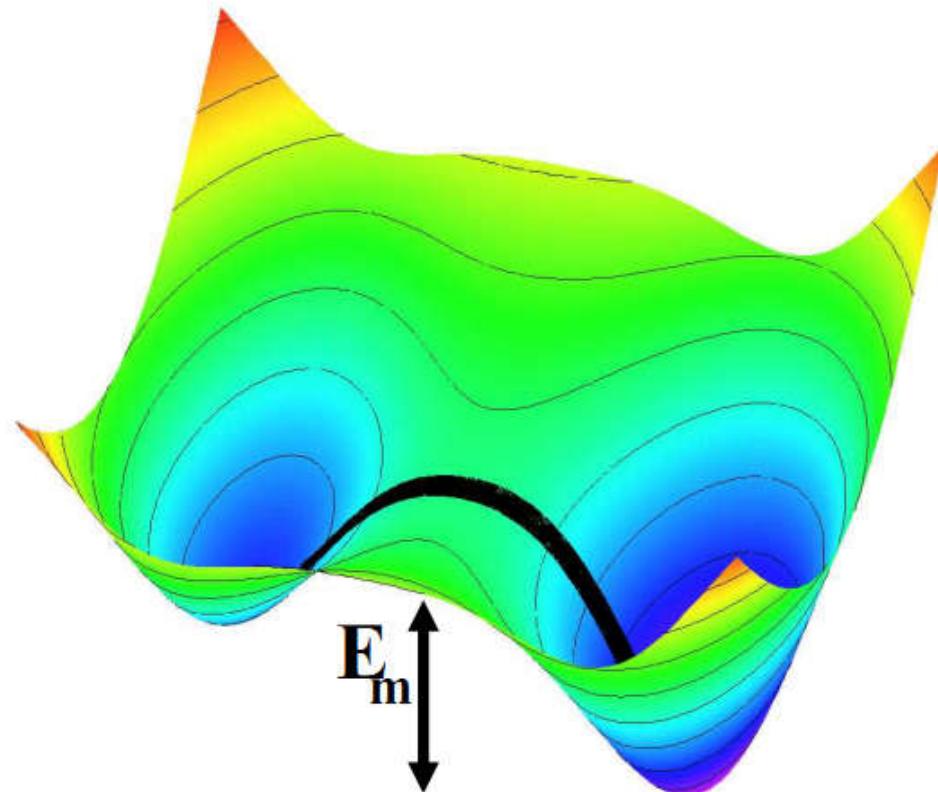

Table 1. Calculated heats of formation for Li phosphates, phospho-nitrides, and thiophosphnates and related materials. The structural designation uses the notation defined in the International Table of Crystallography⁸⁵ based on structural information reported in the International Crystal Structure Database.⁸⁶ The heats of formation ΔH (eV/FU) are given in units of eV per formula unit. When available from Ref. [31] and [32] experiment values are indicated in parentheses. Those indicated with “*” were used fitting the O and N reference energies as explained in the text.

Quantitative study of interfaces – (Lepley & Holzwarth, *PRB* **92** 214201 (2015))

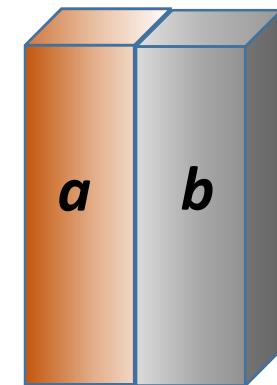

WAKE FOREST
UNIVERSITY

Within any given periodic simulation cell with n_a units of material a and with n_b units of material b , we can define an interface energy:

$$\tilde{\gamma}_{ab}(\tilde{\Omega}, n_a, n_b) = \frac{\tilde{E}_{ab}(\tilde{\Omega}, A, n_a, n_b) - n_a E_a - n_b E_b}{A}$$

area of interface
 within supercell \nearrow
 bulk energies

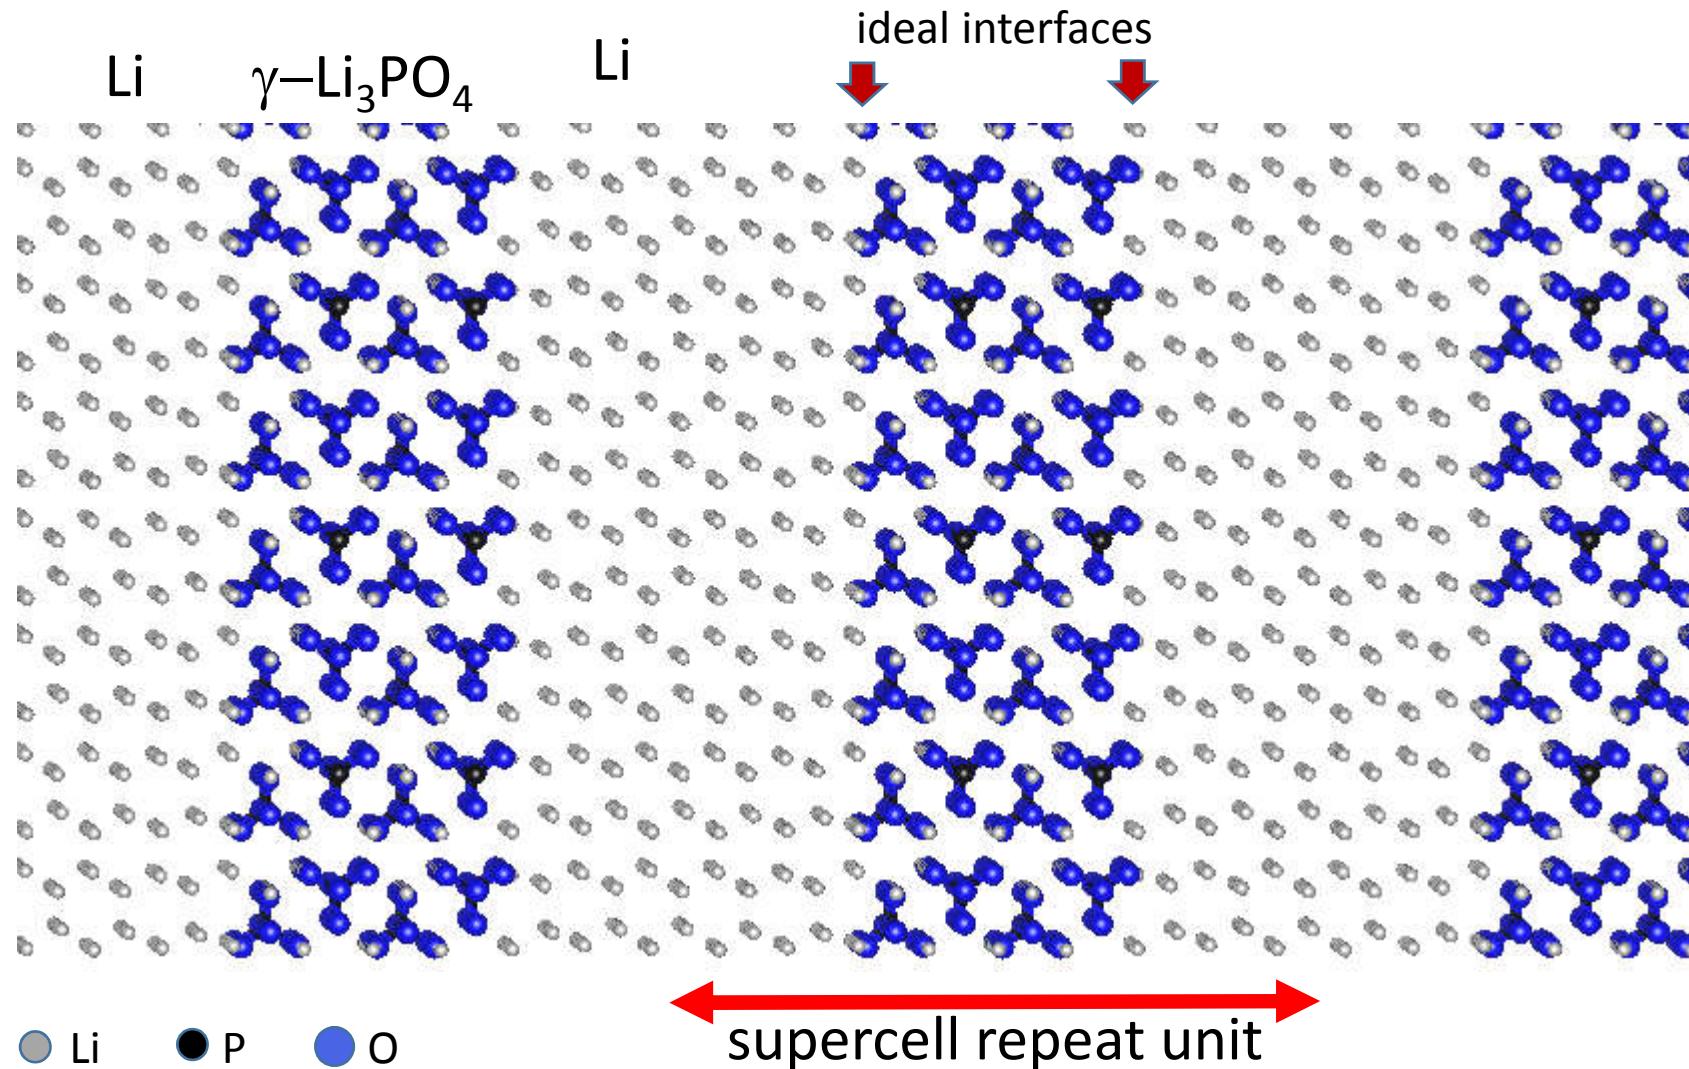

In order approximately remove the effects of lattice strain:

- Design the supercell to be commensurate with lattice a
- Now the strain will scale with the amount of material b

$$\Rightarrow \tilde{\gamma}_{ab}(\tilde{\Omega}, n_a, n_b) = \tilde{\gamma}_{ab}^{\lim}(\tilde{\Omega}) + n_b \sigma$$

It is convenient to model the interface between a solid electrolyte and solid electrode in the slab geometry using a periodic simulation cell:

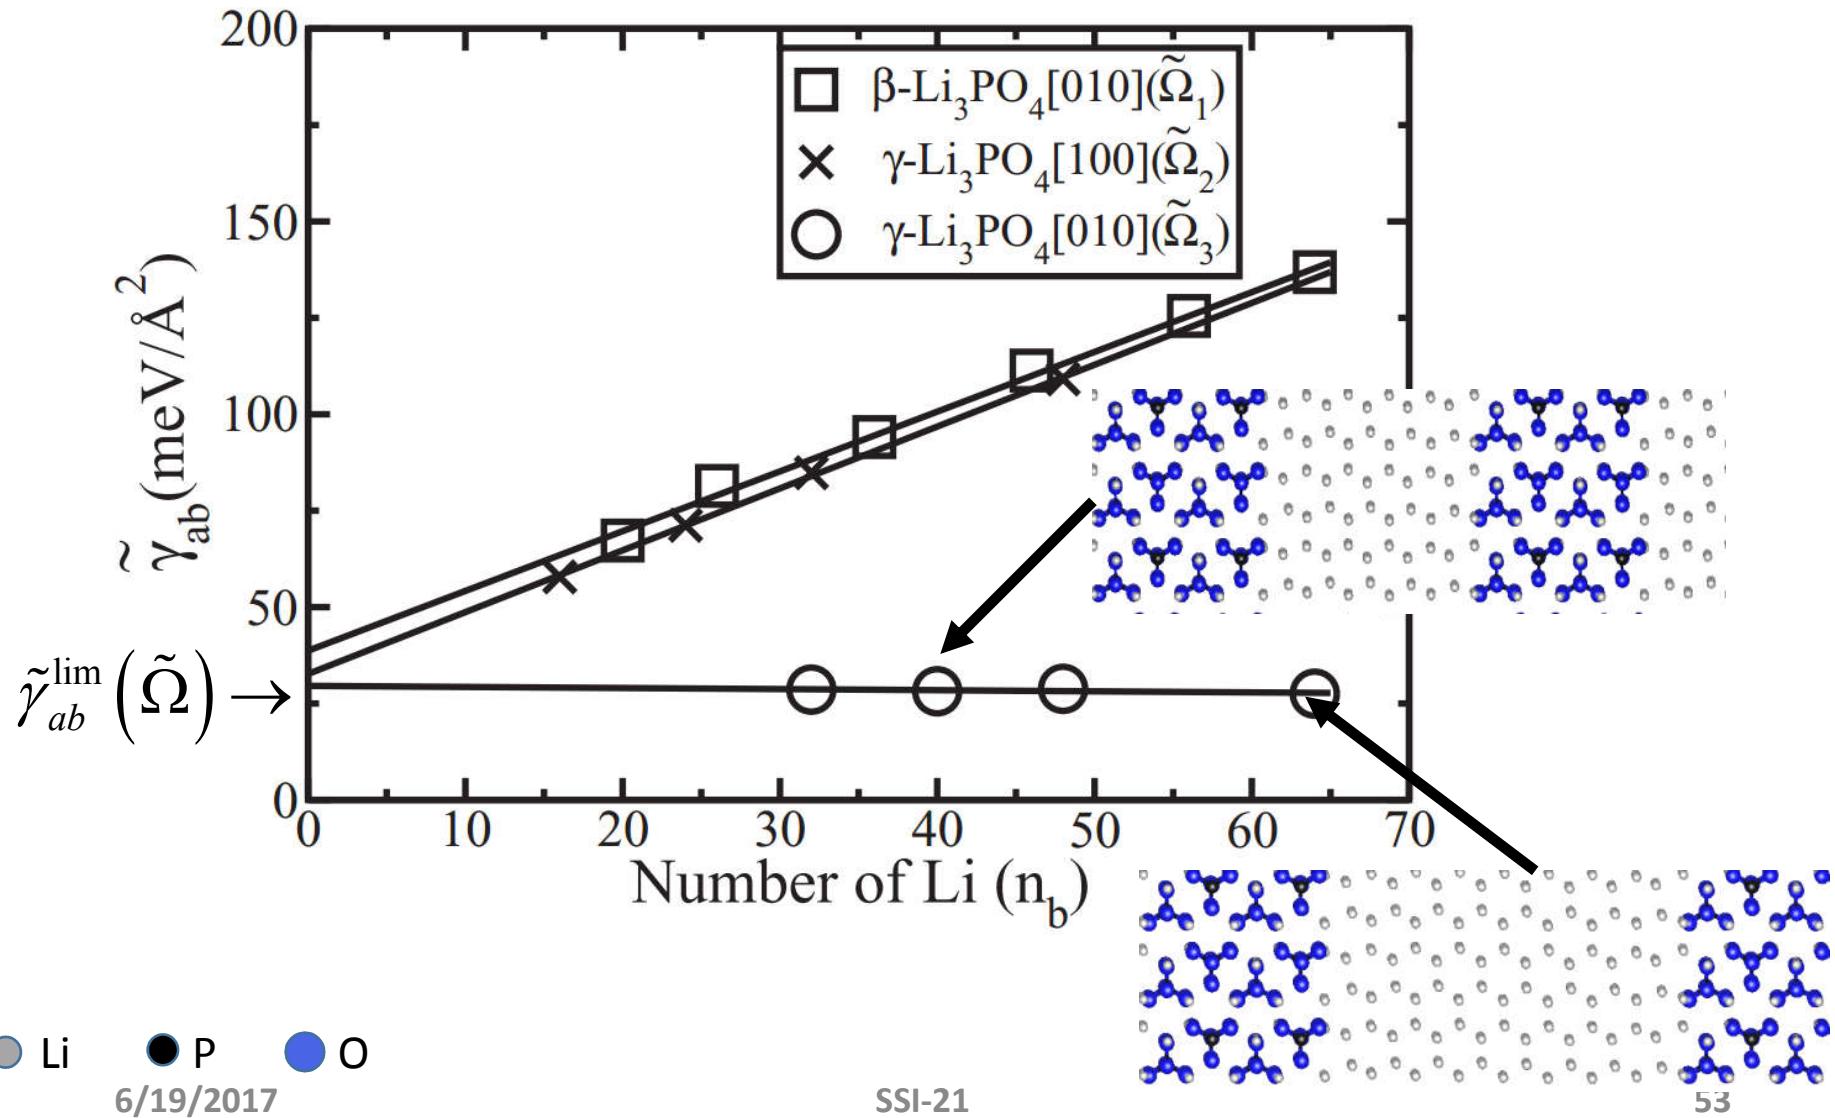

Lepley's linear equation for the interface

$$\text{energy: } \tilde{\gamma}_{ab}(\tilde{\Omega}, n_a, n_b) = \tilde{\gamma}_{ab}^{\lim}(\tilde{\Omega}) + n_b \sigma$$

Thoughts on the role of simulations in developing battery technology

- Ideal research effort in materials includes close collaboration of both simulations and experimental measurements.
- For battery technology, there remain many opportunities for new materials development.
