

**PHY 712 – Problem Set #5**

Consider a three-dimensional charge distribution of the form:

$$\rho(\mathbf{r}) = \frac{q}{\pi^{3/2}a^3} e^{-(r/a)^2}$$

where  $q$  and  $a$  are constants.

1. Show that the electrostatic potential  $\Phi(\mathbf{r})$ , as a function of the distance  $\mathbf{r}$  from the center of the charge distribution  $\rho(\mathbf{r})$  is given by

$$\Phi(\mathbf{r}) = \frac{1}{4\pi\epsilon_0} \int d^3r' \frac{\rho(\mathbf{r}')}{|\mathbf{r} - \mathbf{r}'|} = \frac{q}{4\pi\epsilon_0} \frac{\text{erf}(r/a)}{r}.$$

2. Now suppose that a grounded metal plate is placed at a distance  $-d\hat{\mathbf{z}}$  from the center of the charge distribution. Find the electrostatic potential due to  $\rho(\mathbf{r})$  and the boundary condition  $\Phi(x, y, z = -d) = 0$  for a general point  $\mathbf{r}$  with  $z > 0$ .
